## **Experiment – 6: MongoDB**

Name of Student	Rujuta Medhi
Class Roll No	D15A-27
D.O.P.	06.03.25
D.O.S.	
Sign and Grade	

**1. Aim:** To study CRUD operations in MongoDB

#### 2. Problem Statement:

**A.** Create a database, create a collection, insert data, query and manipulate data using various MongoDB operations.

- 1. Create a database named "inventory".
- 2. Create a collection named "products" with the fields: (ProductID, ProductName, Category, Price, Stock).
- 3. Insert 10 documents into the "products" collection.
- 4. Display all the documents in the "products" collection.
- 5. Display all the products in the "Electronics" category.
- 6. Display all the products in ascending order of their names.
- 7. Display the details of the first 5 products.
- 8. Display the categories of products with a specific name.
- 9. Display the number of products in the "Electronics" category.
- 10. Display all the products without showing the "\_id" field.
- 11. Display all the distinct categories of products.
- 12. Display products in the "Electronics" category with prices greater than 50 but less than 100.
- 13. Change the price of a product.
- 14. Delete a particular product entry.

#### 3. Theory:

# a. Describe some of the features of MongoDB?

## Features of MongoDB

MongoDB is a **NoSQL database** that offers several features:

**Document-Oriented Storage** – Stores data in flexible, JSON-like BSON documents.

**Schema Flexibility** – No fixed schema, allowing dynamic and hierarchical data structures.

Scalability – Supports horizontal scaling using Sharding.

**Indexing** – Uses indexes to improve query performance.

**Replication** – Ensures high availability using **Replica Sets**.

**High Performance** – Fast read and write operations, making it efficient for big data applications.

## b. What are Documents and Collections in MongoDB?

**Document**: A JSON-like data structure containing key-value pairs. Example:

```
{
    "name": "John",
    "age": 25,
    "skills": ["MongoDB", "Node.js"]
}
```

**Collection**: A group of related documents, similar to a table in relational databases.

c. When to use MongoDB?

MongoDB is useful when:

- 1. Handling large-scale unstructured data (e.g., IoT, logs, user-generated content).
- **2.** Applications require high-speed read/write operations (e.g., real-time analytics).
- **3. Scaling horizontally** is necessary due to growing data.
- **4. Flexible schema** is required, such as for social media platforms or content management systems.

#### d. What is Sharding in MongoDB?

Sharding is **MongoDB's method of horizontal scaling**, where data is distributed across multiple servers (shards). It helps:

- 1. Improve performance by distributing queries.
- 2. Handle large datasets beyond a single machine's capacity.
- **3. Ensure high availability** and fault tolerance.
- **4.** Sharding is implemented using a **shard key**, which decides how data is distributed across servers.

#### **Output:**

- 1.Use inventory;
- **2.**db.createCollection("products");

```
3. db.products.insertMany([
  ProductID: 11,
  ProductName: "Rujuta-27 Laptop",
  Category: "Electronics",
  Price: 999.99,
  Stock: 50
 },
  ProductID: 12,
  ProductName: "Rujuta -27 Smartphone",
  Category: "Electronics",
  Price: 699.99,
  Stock: 150
 },
1)
 > db.products.insertMany([
       ProductID: 11,
       ProductName: " Rujuta-27 Laptop",
       Category: "Electronics",
       Price: 999.99,
       Stock: 50
     },
       ProductID: 12,
       ProductName: "Rujuta -27 Smartphone",
       Category: "Electronics",
       Price: 699.99,
       Stock: 150
     },
  1)
 < {
     acknowledged: true,
